

OIL INDIA LIMITED - WELL COMPLETION REPORT

CONFIDENTIAL / SYNTHETIC DEMONSTRATION REPORT — NOT ACTUAL OIL DATA

Report Title: End of Well Report & Completion Summary

Target Well: WELL-B | Document Type: Well Completion Report

System: NWIS RAG Archive

1. Operational Overview

Well: WELL-B was spudded on 2021-03-10 and drilled to final target depth of 3,100 m.

Synthetic demonstration report — not actual OIL data.

Primary target formations encountered include Tipam Sandstone, Barail Series, and Formation-X.

2. Critical Geological & Drilling Incident

Date: 2021-05-14

Severe mud losses occurred at 2475 m while penetrating the upper section of Formation-X (Naga Thrust Zone).

Loss Rate: Initial total loss rate estimated at 45 bbl/hr with standpipe pressure dropping by 350 psi.

Event: Mud Loss. Severity: Severe.

Cause: Intersected natural micro-fracture network within high-permeability zone of Formation-X.

Mitigation: Applied high-viscosity LCM treatment pill containing 40 ppb coarse fibrous material and mica.

Outcome: Losses reduced to 2 bbl/hr seepage; LCM treatment was applied and drilling resumed.

3. Post-Drilling Parameters

Mud Weight: 1.18 SG, ROP: 14 m/hr, WOB: 18 klb, Flow Rate: 420 gpm.

Casing 9-5/8 inch set successfully at 2650 m.
